Should this page go live?

We checked 8 pages against a saved sample report. Nothing here calls the live web. The page cannot know whether it was named. The report can. The loop waits for both before it says ship or hold.

A page can go live when its address, text, and hidden label agree with the report. How often it was named can be low. A missing score holds it back. Every decision is written to an audit log you can open later.

Should this page go live?

We checked 8 pages with a saved sample report. Nothing here calls the live web or a live naming report. The loop still does the same job: fetch facts, run the check, keep a written decision.

2
can go live

6
held back

The pages

Page	Language	Address	How often named
Berlin taxes (DE)	de	/de/steuern-berlin	0.5
Berlin taxes (EN)	en	/en/taxes-berlin	—
Home office (DE)	de	/de/homeoffice	0.05
Filing deadline (EN)	en	/en/filing-deadline	—
Empty page	de	/de/steuern-berlin	0.5
Wrong hidden label	de	/de/steuern-berlin	0.5
Wrong public address on page	de	/de/steuern-berlin	0.5
Missing how-often-named score	de	/de/kirchensteuer	—

What we decided

Page	Decision	Why
Berlin taxes (DE)	Can go live	The page and the report match, so it can go live.
Berlin taxes (EN)	Held back	This address is not in the report, so it stays held.
Home office (DE)	Can go live	The page and the report match, so it can go live.
Filing deadline (EN)	Held back	This address is not in the report, so it stays held.
Empty page	Held back	The page has no text, so it stays held.
Wrong hidden label	Held back	The hidden label does not match the address, so it stays held.
Wrong public address on page	Held back	The public address on the page does not match what we expected, so it stays held.
Missing how-often-named score	Held back	The report lists the page, but not how often it was named, so it stays held.

What this is worth

- Publishing stops being a gut feel. The page and the naming report have to agree first.
- A low “how often named” score still lets a page go live. A missing score does not. That difference is easy to miss by hand.
- Empty text, a wrong hidden label, or a wrong public address hold the page before the report is even used.
- Each run leaves a written trail. You can show a teammate why something stayed held without opening five tabs.

Run the check again with `python experiments.py`. For a live fetch later, use `python loop.py --live` with a Firecrawl key.
